POST STROKE PARTICIPANTS NEEDED FOR RESEARCH AND DEVELOPMENT OF HOME-BASED GAMIFIED EXERCISES SYSTEM

Have you had a stroke that affects one of your upper limbs? You may be eligible for a research study. The study aims to develop an upper limb rehabilitation robotic system for home-based use to help with the rehabilitation of impairment limb. You will be interacting with the prototypes of the system and provide your feedback on the experience.

An occupational therapist will perform an assessment of upper limb impairment level. Then you would perform rehabilitation exercises using the prototyped rehabilitation platform and provide your feedback. The iterative design will require attendance of up to 10 sessions with each session taking a maximum of 90 minutes.

You may be eligible if you:

- Had a stroke in less than a year ago
- Have trouble with movement of one of your upper limbs because of a stroke

You will be reimbursed for your time when attending the sessions.
